

Acknowledgements

Person #1: Rahul Saxena (Director of Georgia Tech CREATE-X Startup Accelerator Program)

- **Provided early-stage feedback and validation during discussions about LUMEN AI. He helped us refine our problem definition by pushing us to clearly distinguish between reading fluency and true comprehension, and emphasized the importance of designing for real classroom constraints such as limited teacher bandwidth and diverse student learning levels. His feedback encouraged us to strengthen the real-world applicability of LUMEN AI, especially in terms of scalability across different school environments and accessibility for students who lack individualized reading support.**

Person #2: Christopher Klaus (Tech entrepreneur and Founder of Klaus Building at Georgia Tech)

- **Provided informal guidance and feedback on the LUMEN AI concept during early discussions. He helped us think more critically about long-term scalability, real-world deployment challenges, and the importance of building solutions that can transition from prototype to impactful education technology. His input encouraged us to sharpen our focus on measurable learning outcomes, data-driven insights for educators, and ensuring that the system design could realistically operate in both classroom and home environments at scale.**
