

Impact and Scale

Target users of Lumen AI:

Lumen AI primarily targets elementary and middle school students (grades 3–8), especially those struggling with reading comprehension, including English language learners and students in under-resourced schools. It also serves teachers and parents who need real-time visibility into student understanding. In the U.S. alone, over 50 million K–12 students could benefit, with NAEP data showing that roughly 65–70% of students are not proficient in reading comprehension.

Scaling up or modifying Lumen AI to have a positive impact on the largest possible audience:

Lumen AI can scale globally through a low-cost mobile app version paired with optional hardware, supporting any device with a camera. By localizing language support and adapting Lexile-based models across curricula, it can expand to hundreds of millions of students worldwide. Integration with school LMS systems (Google Classroom, Canvas) and cloud-based analytics would allow district-wide deployment, enabling real-time learning insights at population scale and advancing UN SDG 4 (Quality Education) and SDG 10 (Reduced Inequalities).
